The Fire Department of London—A Sketch of its Organization and Administration.

The establishment of the Fire Department of the City of London, Ont., is an interesting problem in the history of municipal government. The city, which is situated on the Thames River, is a small town with a population of about 10,000. It is divided into six wards, each with its own fire station and engine company. The fire department consists of a chief engineer, two assistant engineers, and six clerks. The chief engineer is responsible for the design and construction of the fire stations and the purchase of the necessary equipment. The assistant engineers are in charge of the operation of the fire stations and the training of the firefighters. The clerks are responsible for the maintenance of the records and the preparation of the reports of the fire department.

The fire department of London is small in size, but it is well equipped and efficiently operated. The fire stations are well built and equipped with the latest apparatus, and the firefighters are well trained and well disciplined. The fire department is well organized and well managed, and it is capable of handling any emergency that may arise. The firefighters are well paid and well fed, and they are well treated by the city authorities. The fire department is a model of efficiency, and it is a credit to the city of London.
