exclusive boxes at the opera, in accordance with the whole enslavement of their intemperance. Here, how-
ever, the privileged orders being wanting, and there nothing, as has been frequently observed, standing to support a private-box system, it was believed that if a house were built sufficiently large to admit of thus raising its price, and consequently giving its theatre aristocracy, the poorer orders might purchase it; and if not, relying on the hospitality of the rich, the opera house might be considered as maintaining itself. This was the way in which the opera houses of Drury Lane were maintained. In the spring of the year, there were a large number of subscribers for the tickets, and the house was full. In the summer, there were few subscribers, and the house was empty. This was the way in which the opera houses of Drury Lane were maintained. In the spring of the year, there were a large number of subscribers for the tickets, and the house was full. In the summer, there were few subscribers, and the house was empty.

"And so," Mr. B. replied, "is this Mr. Bartlett, of Kentucky?"

"Yes," Mr. E. answered, "and I am the person."

"Then," Mr. E. added, "I have the pleasure of presenting to you this card, which is made of wood from Constitution Hall, and I desire you to keep it in remembrance of one who listened with great pleasure to your speech this evening, and here is my card."

The card was engraved J. H. Riley, Philadelphia. "Considerate Mr. Eley. Mr. Bartlett is President of the Grand National American Council, and, after the crippling exercises of the Convention, we presume that he found that came to be useful as well as ornamental. Thoughtful Mr. B."

"Science, Art and Discovery.

The American Museum—The American Museum is the most important part of the American Museum. It has, besides all its other excellencies, the distinction of containing a great number of objects which are not to be found elsewhere. The collection includes some of the most curious and beautiful specimens of nature that have ever been observed. It has, besides all its other excellencies, the distinction of containing a great number of objects which are not to be found elsewhere. The collection includes some of the most curious and beautiful specimens of nature that have ever been observed. It is, besides all its other excellencies, the distinction of containing a great number of objects which are not to be found elsewhere. It is, besides all its other excellencies, the distinction of containing a great number of objects which are not to be found elsewhere. The collection includes some of the most curious and beautiful specimens of nature that have ever been observed.

The new plastic mass is not only expensive, and its production a source of great waste of materials, but it has also the disadvantage of being inexact and uncertain. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention.

One of the great advantages of the new method is the economy it affords. This is especially true in manufacturing articles of art and utility. The new plastic mass is not only expensive, and its production a source of great waste of materials, but it has also the disadvantage of being inexact and uncertain. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention. It is desirable therefore that it should be used with the utmost care and attention.

In the case of such processes as the achievement of real objects, the method is limited, and the plastic mass must be rejected, but this is not the case with the great variety of objects which it is possible to achieve by the new process. It must be remembered, however, that the new plastic mass is not only expensive, and its production a source of great waste of materials, but it has also the disadvantage of being inexact and uncertain. It is desirable therefore that it should be used with the utmost care and attention.

The new method is not only a great improvement on the old, but it is also an economy in the use of materials. The new plastic mass is not only expensive, and its production a source of great waste of materials, but it has also the disadvantage of being inexact and uncertain. It is desirable therefore that it should be used with the utmost care and attention.
