The Water Department.

The new officers of the Water Department are in the midst of their work. The city is supplied with water by two reservoirs, one at the Spring Garden Reservoir, and the other at the Southwark Reservoir. The former is situated on the upper part of Pennington Street, and the latter on the west side of the city. The water is supplied from these reservoirs by means of pipes, which are laid out in a network throughout the city. The water is purified by means of filters, and is then sent to the houses by means of pumps. The water is of excellent quality, and is supplied in sufficient quantity for all the purposes of the city.

The Water Department has a large number of employees, who are kept busy at all times. The work is done with great care and attention, and the water is supplied in a pure and wholesome state. The water is used for a variety of purposes, such as drinking, cooking, and washing. The city is supplied with water in excess of what is required, and the surplus is used for the purpose of flushing the streets. The water is also used for the purpose of extinguishing fires. The city is supplied with water in a large and convenient manner, and the water is of excellent quality.

The Water Department is under the control of the Corporation, and the officers of the department are responsible to the Corporation for the efficient and economical management of the water supply. The department is well organized, and the officers are selected with great care. The work is done with great care and attention, and the water is supplied in a pure and wholesome state. The water is used for a variety of purposes, such as drinking, cooking, and washing. The city is supplied with water in excess of what is required, and the surplus is used for the purpose of flushing the streets. The water is also used for the purpose of extinguishing fires. The city is supplied with water in a large and convenient manner, and the water is of excellent quality.
