Railroad Accidents During the Year 1857.

The following table shows the number of accidents, by which persons have been killed or wounded, which have occurred on the different rail roads in the United States during the past year, together with a comparative table of the number of such accidents which took place in the same period of the year 1856.

As the table will show, there has been a marked decrease in the number of accidents which has taken place on the rail roads during the past year, as compared with that of the year 1856.

The reduction in the number of accidents is due to several factors, including improved engineering practices, better maintenance of the rail roads, and increased public awareness of safety measures.

The table also shows the number of accidents which have occurred on each of the rail roads, as well as the number of persons killed or wounded in each accident.

The data presented in the table provides valuable information for rail road operators and safety officials in their efforts to reduce the number of accidents and improve safety on the rail roads.
